```
7 Nov 2026 - Live Citi Bike Feed - signoff.exe

watcher > run #1: 2,520 stations
47 report a last update in 1970 -> INC-001 opened
```

Signoff

AI agents catch bad data in the team chat.
A person signs off on the fix.

Built on Switch | Mattermost · live GBFS data | Track 01: Best Business Workflow

Paras Adlakha · Harshita Adlakha

Gemini Notebook

A truck goes wherever the data says. Nobody in the room knows it's wrong.

PHYSICAL STRAIN

47

Citi Bike stations reporting a last update in 1970 (plus 6-9 over capacity and 27-29 silent for a day).

Source: Signoff, first live run, 7 Nov 2026.

REVENUE IMPACT

31%

of revenue affected by data quality issues on average; about 15 hours per incident to resolve.

Source: Monte Carlo survey, 2023.

DOWNSTREAM HARM

92%

of high-stakes AI projects hit compounding downstream harm ("invisible, delayed, but often avoidable").

Source: Sambasivan et al., CHI 2021.

FINANCIAL COST

$12.9M

a year: average cost of poor data quality per organization.

Source: Gartner, reference-customer survey.

AGENTIC RISK

40%+

of agentic AI projects expected to be cancelled by 2027, citing cost, value and inadequate risk controls.

Source: Gartner, June 2025.

REGULATION

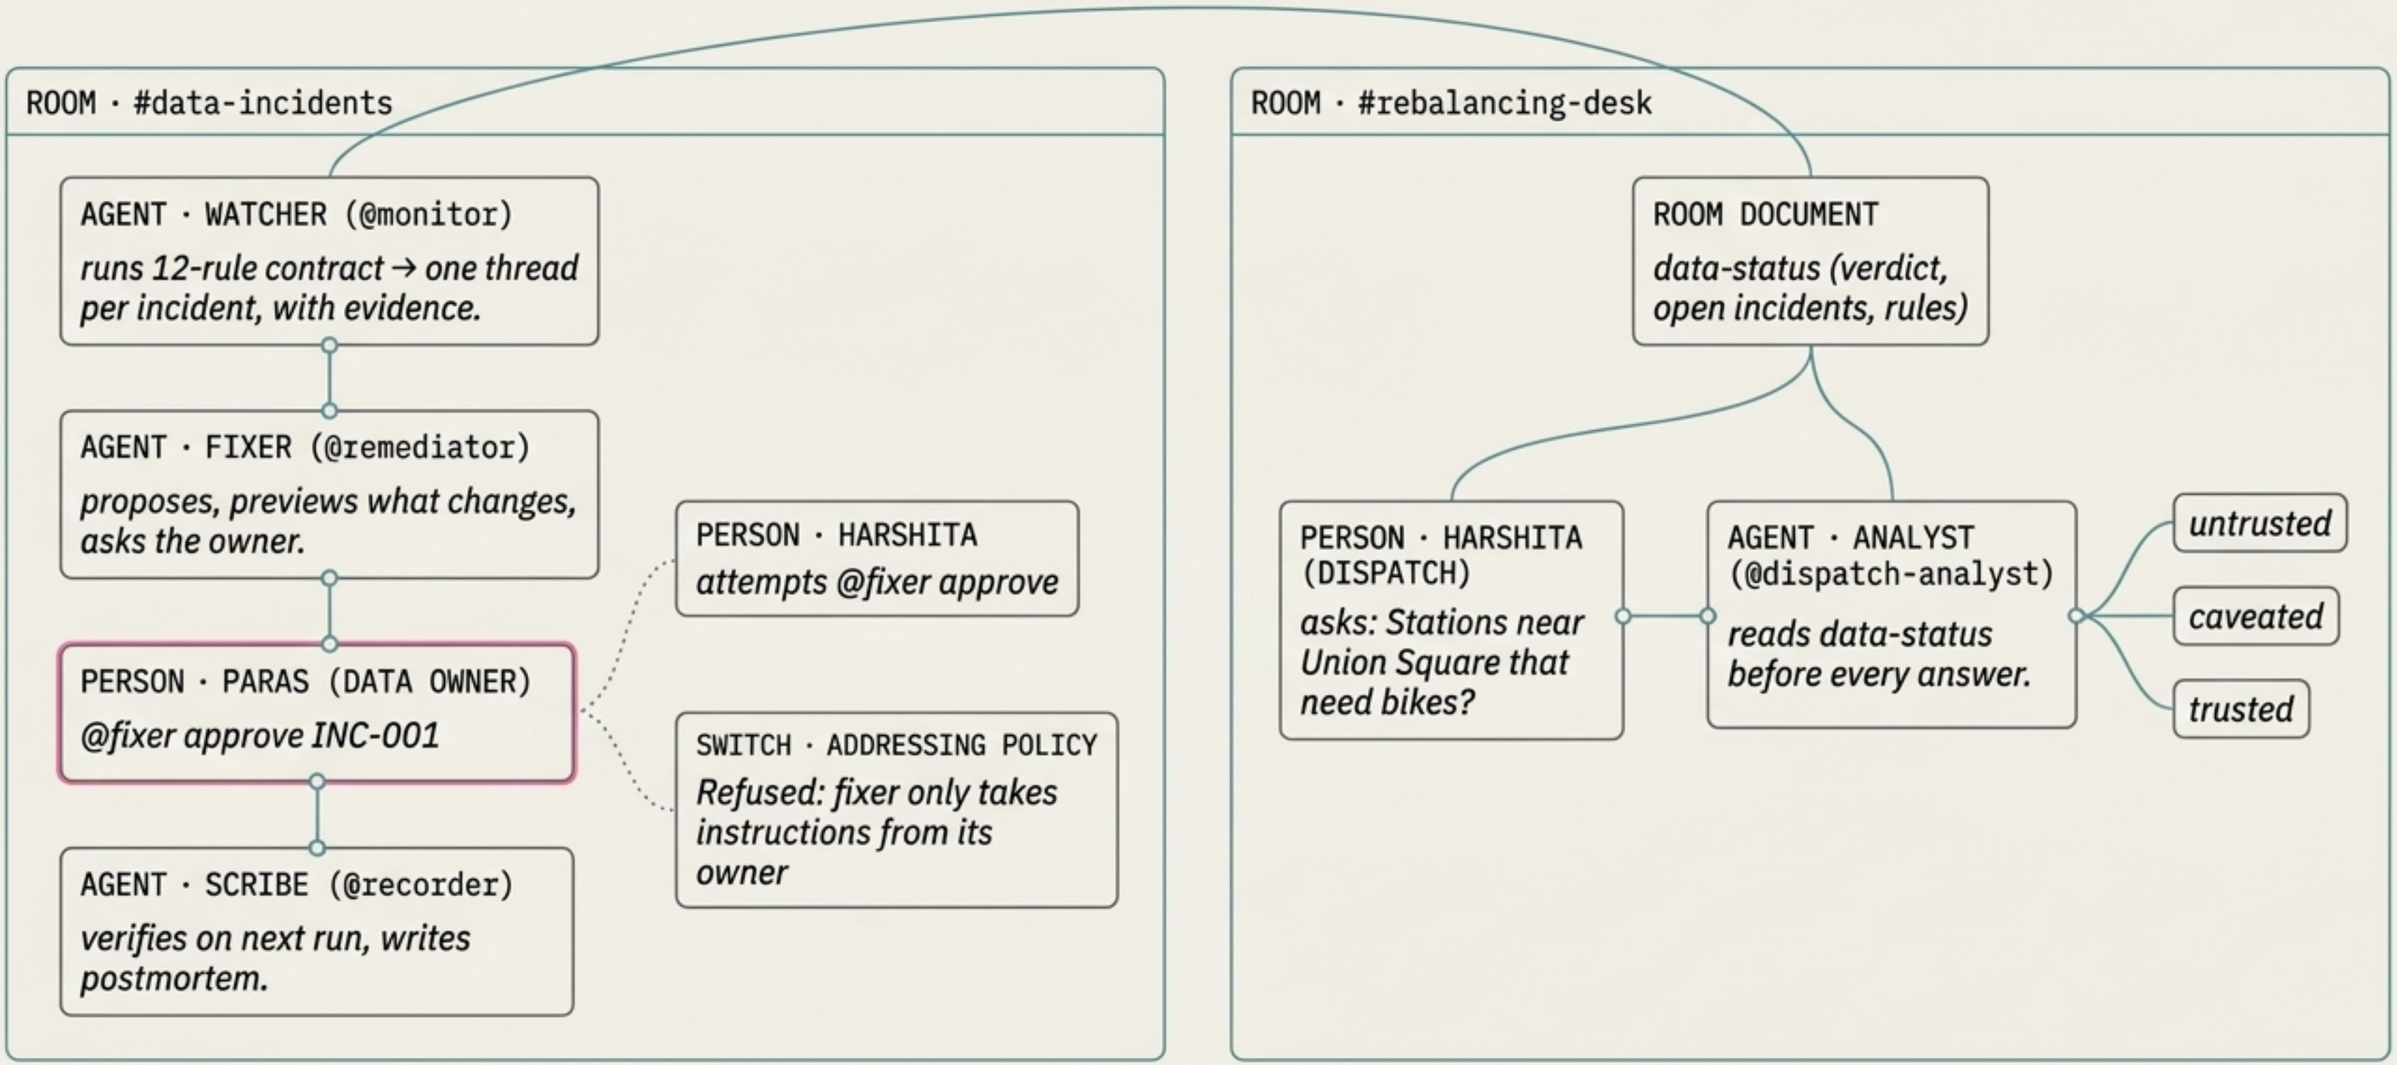

Art.14

EU AI Act: overseers must be able to understand, override and stop high-risk AI.

Source: Regulation (EU) 2024/1689.

Gemini Notebook

Detect → propose → sign off → verify → gate.

Gemini Notebook

Only the data owner can change how data is treated.

A fix without a preview is a guess.
A fix without a signature is a liability.

The Preview

```
Preview: 47 stations stay out of the
dispatch view (22 of them in Manhattan
below 96 St).
```

Every option is previewed, applied in one transaction with the approver's name, and verified on the next run. Nothing deleted.

The Enforcement

```
Harshita types "@fixer approve INC-001"

I only take instructions from my owner...
```

```
fixer.addressing = "owner_and_owner_agents"
```

The gate is the platform's addressing policy, not our code.

Gemini Notebook

Gate the answer, not just the dashboard.

A silent watcher is a failed watcher.

Status State	Trigger Condition	Downstream Agent Action
🔴 **Untrusted**	Unhandled feed incident OR silent watcher (no run in 3 minutes).	Outright refusal. 🛑 I won't send a truck on this data. (Includes reasons and pointer to #data-incidents).
🟡 **Caveated**	Station-level incident is open (bad stations are held). Or a signed-off fallback rule is active.	Answer provided, but open incidents are explicitly named alongside the data. (e.g., Data 5 min old).
🟢 **Trusted**	Answer provided, all feed data clean or explicitly handled.	Clean answer provided. All stations explicitly cited with source annotations [1], [2].

Gemini Notebook

Telemetry & Feedback: What We Learned

PLATFORM_GOVERNANCE

The gate belongs in the platform.

We deleted our own "if sender === owner" check because Switch's addressing policy handles it natively, visibly, and applies to any future agents we add.

AGENT_ROUTING

Hand off to jobs, not names.

Addressing the '@remediator' role instead of a named '@fixer' bot allows us to swap the agent behind the job without touching the watcher.

STATE_CONTRACTS

A room document is a contract between agents.

The analyst never pings the watcher. It simply reads the 'data-status' document—which a human can also read, making the trust state explainable for free.

RESILIENCY

Plan for dropped connections.

Sockets drop under load. Agents must reconnect with the same connection ID, resume from the cursor, and re-claim their room and role automatically.

Gemini Notebook

Agents can watch the data. People still have to own the decision.

Governance

2-person sign-off for feed-level incidents; rule expiry.

Investigator Role

A coding agent run by Switch Console for read-only root cause analysis.

Scale

Extending to Slack/Teams bridges and 1,000+ GBFS feeds.
